> Dura is a background process that watches your Git repositories and commits your uncommitted changes without impacting HEAD, the current branch, or the Git index (staged files). If you ever get into an "oh snap!" situation where you think you just lost days of work, checkout a `dura` branch and recover.

Interesting approach to keeping your git repository always up-to-date.

Found on tkelloggdura: You shouldn't ever lose your work if you're using Git on 2022-01-21 23:19:13.
