Wednesday, February 8, 2023

A good API product manager needs to be able to properly identify product opportunities, support the actual development process, collect and act on feedback through multiple iterations, and know how to monitor and measure success for the product. In addition, they need to enable improvements for APIs already released into the market and in use by paying customers.

Found on WTF is API Product Management? on 2023-02-08 10:17:58.
