No surprises what I think is the answer (and I'm not the only one. The Fraunhofer Institute and Ericsson agree on this video). I think semantically-described digital twins operating in ecosystems is the way forward. Especially if you think of digital twins as “nano-API” for one instance of a resource type. A ship, a sewage tank, a person, whatever, but only one of them, not a whole bunch.

Found on Why I hate APIs - IOTICS on 2023-02-07 22:25:25.
